## 1. Introduction

---

The EU marine data management experience of EMODnet Chemistry continues on its 4th phase (2019-2021). The focus has been further expanded with data access and gathering for new marine litter datatypes. In fact, after consultation with relevant EU stakeholders (JRC, TG-ML, RSC's, ...), new marine litter datatypes are now considered, enlarging the marine litter data management challenge to include:

- seafloor litter images and videos
- microlitter in sediment
- floating macro litter

These will integrate the beach litter, seafloor litter and floating microlitter databases already handled.

The data management involves further population of the EMODnet Chemistry CDI (Common Data Index) Data Discovery and Access service, as well as updating and refining the data products (validated data collections) and their visualizations in a dialogue with the board of MSFD experts.

This document provides background information about the status of the art and management strategy for seafloor litter images and video. In particular, it provides information on how to deal with marine litter data related to seafloor videos and images under EMODnet Chemistry, the formats for gathering, and how EMODnet Chemistry network should manage this kind of marine litter data sets.

## **2. Seafloor images, status of the art and best practices at EU and Global Level**

---

The principle of EMODnet Chemistry to face the new litter topics, is to analyse in detail the best practices already developed by consolidated communities and then propose a format able to handle all the available information with a focus on the European and global perspective.

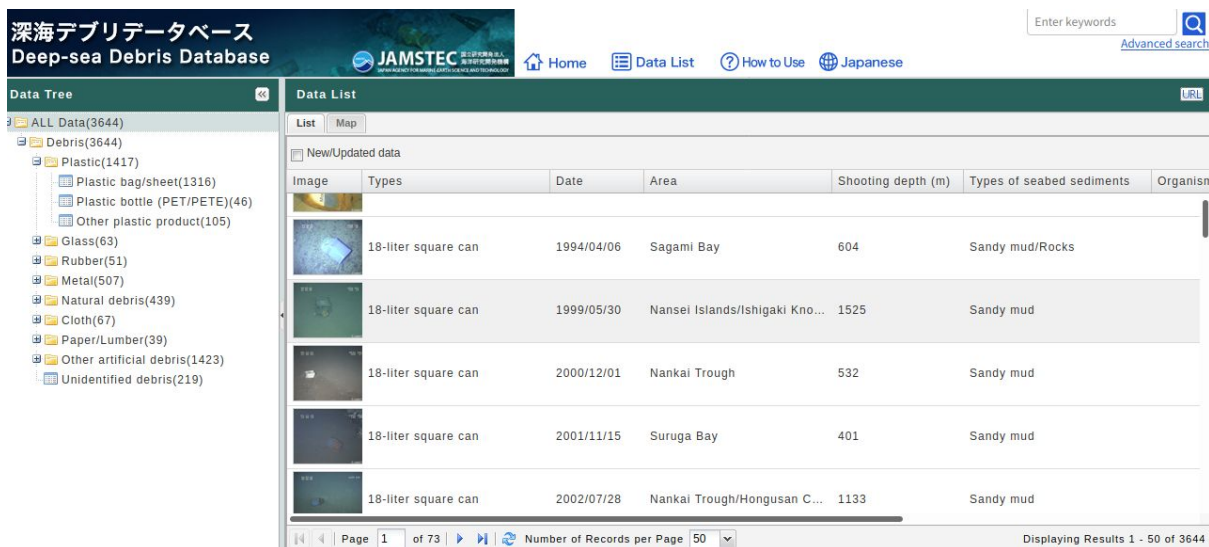

Thanks to the interactions with the stakeholders, the seafloor litter dedicated workshops organized by JRC (to provide an overview of the data management status for seafloor litter images), and Oceanobs '19 conference Marine Debris breakout session, the following EU and global experiences have been highlighted.

### **Jamstec experience**

During the seafloor litter workshop organized by JRC (AWI, Germany, May 2018) and the Oceanobs '19 breakout session on Marine Debris (Oceanobs '19 conference, Honolulu, 2019), EMODnet Chemistry gained a set of fruitful interactions with relevant actors in the marine debris data management. One of these relevant contacts is JAMSTEC -Japan Agency for Marine-Earth Science and Technology. They have the first (and unique) example of seafloor debris images and videos online accessible database (<http://www.godac.jamstec.go.jp/catalog/dsdebris/e/>). Their service visualizes a list of debris classified by shapes/materials where litter items are categorized and linked to their videos and photos.

A list of litter/debris categories with a thumbnail of the litter image is provided with some general information (type, date, area, depth, seabed, organisms (presence: yes/no), and link to the map ). Through the thumbnail it is possible to access to further information like:

- type of sediment
- area
- coordinates
- submersible & Dive No.
- biological information
- link to images and video

JAMSTEC has handled data from deep-sea research submersibles since 1982. They have encoded video tapes to digital files and archived them on online storage since 2002. The total amount of videos and photos is approximately 350TB over 38 thousand hours of videos and 1.5 million photos.

They have a magnetic tape library system used in combination for long-term backup and regular access.

Additionally, the seafloor litter workshop, organized by JRC, highlighted two further EU examples of seafloor images datasets, which is described below.

## Ramoge cruise data by IFREMER and ISPRA:

IFREMER (France) and ISPRA (Italy) participated to the “Ramoge” cruise where seafloor litter/debris images and videos were taken and the following information ([Annex A](#)) were extrapolated in a data sheet:

- dive number
- number of video
- time
- picture number and code
- camera code
- comments
- coordinates
- depth

- cape
- altitude
- number(class of number) and type of litter items (specified using TG-ML list)
- entanglement information(interaction with organisms, type of impact, number of species affected, type of species, comments)

## ISPRA institute example

Ispra provided a dataset as an example of their experience on seafloor images information. In the example the following information are provided ([Annex B](#)):

- year
- campaign
- place
- dive
- picture n.
- date
- time
- latitude
- longitude
- depth
- litter items

## 3. EMODnet Chemistry seafloor images data management proposal

---

The comparison between the previous experiences of seafloor images campaigns together with data management and suggestions from relevant experts highlighted a set of significant information to be managed:

- Date and time
- Position (lat, lon)
- Depth
- Substrate (EN ISO 14688-1 classification- Particle size fractions and categories of seabed substrate for visual surveys of the seabed from “Water quality - Visual seabed surveys using remotely operated and/or towed observation gear for collection of environmental data” or SeaDataNet vocabularies:
  - GS3 (lithology classes):[https://vocab.seadatanet.org/v\\_bodc\\_vocab\\_v2/search.asp?lib=GS3](https://vocab.seadatanet.org/v_bodc_vocab_v2/search.asp?lib=GS3)
  - GS5 (grains descriptor):  
[https://vocab.seadatanet.org/v\\_bodc\\_vocab\\_v2/search.asp?lib=GS4](https://vocab.seadatanet.org/v_bodc_vocab_v2/search.asp?lib=GS4)
  - GS6 (grains descriptor):  
[https://vocab.seadatanet.org/v\\_bodc\\_vocab\\_v2/search.asp?lib=GS6](https://vocab.seadatanet.org/v_bodc_vocab_v2/search.asp?lib=GS6)
- Litter information:
  - Items list/protocol (TG-ML litter reference list, compatible with all RSCs lists)
  - Litter item type
  - Litter item number
- Entanglement information:
  - Entanglement yes/no
  - Entanglement type (vocabulary tbd)
  - Entanglement species (SeaDataNet vocabulary S25, BODC parameter semantic model biological entity names)
  - Entanglement n. of organisms
- Link to picture
- Link to movie
- Instrument (SeaDataNet vocabularies L05 or L22, depending if the information will be described on the metadata or on the data format or both)
- Originator Institute (EDMO catalogue)
- Collator Institute (EDMO catalogue)
- Data policy ( SeaDataNet vocabulary L08, Data Access Restriction Policies )
- Comments

As for the previous experiences, the principle is to adopt and adapt (if necessary) the available formats to manage the highlighted information. Otherwise a new format based on the best practices is produced.

The present proposal is to:

- handle all the possible metadata with the Common Data Indexes for online metadata publishing
- handle the data with a xls type file to avoid modifying the litter ODV format (details below)

## CDI format for metadata

CDI format (<https://www.seadatanet.org/Standards/Metadata-formats/CDI>) is already used to manage and publish on line the metadata of the other data types. It would fit well also for seafloor images. The comparison with the recent CDI format reveals that all the mandatory and some of the not-mandatory fields can be filled.

<b>CDI MANDATORY FIELD (mandatory in <b>bold</b>)</b>			
<b>START AND END DATE (AND TIME)</b>			
<b>GEOGRAPHICAL COVERAGE (LAT/LON)</b>			
MINIMUM/MAXIMUM DEPTH OF OBSERVATION			
INSTRUMENT (L05)			
<b>ORIGINATORS OF THE DATASET</b> Role = originator (fixed) ( <b>EDMO</b> )			
<b>METADATA CREATING ORGANISATION</b> Role = pointOfContact ( <b>EDMO</b> )			
<b>DATASET ACCESS RESTRICTIONS (L08)</b>			
<b>MEASURING AREA TYPE</b>			
<b>DATUM OF COORDINATE SYSTEM</b>			
<b>NAME/ALTERNATIVE NAME OF THE DATASET</b>			
<b>DATASET-ID</b>			
<b>ABSTRACT ON DATASET</b>			
<b>ORGANISATION MANAGING THE DATASET</b> Role =custodian ( <b>EDMO</b> )			
<b>PARAMETERS</b>	<b>P02:SLIT;</b>	<b>Sea-floor</b>	<b>litter;</b>
<b>abundanceSeaFloorLitterParameters describing the abundance and nature of litter data collected on the seabed</b>			
<b>PLATFORM (L06)</b>			
<b>STATION NAME and/or CRUISE NAME</b>			

<b>ORGANISATION DISTRIBUTING THE DATASET</b> Role ="distributor" (EDMO)
<b>DATAFORMAT</b>

Of the previous mandatory fields:

- area type needs to be clarified (points or trajectories)
- the platform type needs to be clarified (ship, underwater vehicle)

## Seafloor images data format

For the data handling a first comparison with the litter ODV format has been done. The results are:

- all the mandatory ODV default fields can be easily filled
- there is a number of mandatory fields in ODV microlitter (net opening, mesh size,...) that are specific for floating microlitter surveys and it is not possible to fill them
- not all the additional/optional litter ODV fields can be filled

Consequently, in order to avoid the modification of either ODV or ODV microlitter formats to fit this new data type, the proposal is to generate a new format (based on xls) that contains the following information:

field	content	mandatory (y/n)	comments
Date		y	
Position	(lat/lon/datum)	y	
Depth		y	
Substrate		n	(EN ISO 14688-1 classification- Particle size fractions and categories of seabed substrate for visual surveys of the seabed from "Water quality - Visual seabed surveys using remotely operated and/or towed observation gear for collection of environmental

			data" or SND vocabularies GS 3 or 5 or 6)
Litter protocol/list		y	(TG-ML list or other lists)
Litter item code		y	
Number of items		y	class of numerosity like Ramoge example or number of items?
Entanglements/interactions	yes/no	n	
Entanglements/interactions	type	n	
Entanglements/interactions	nb of species	n	
Entanglements/interactions	species	n	(SDN vocabulary S25 BODC parameter semantic model biological entity names)
Link to pictures		y/n	
Link to movies		y/n	
Link to map?		y	
instrument	L0?! vocab	y	(SDN vocabulary L05 or L22 depending if the information will be managed in CDIs or data format)
originator	edmo	y	(EDMO catalogue)
collator	edmo	y	(EDMO catalogue)
data policy	sdn vocab	y	(L08 SeaDataNet Data Access Restriction Policies vocabulary )
comments		n	

The proposal is to develop a central database at OGS for the storing, management and access to the relevant information while access to pictures from the seafloor and access to the related videos will be responsibility of the data providers, as well as to keep up to date the link to reach the information.

It seems a good compromise to leave the storing and access of the images and videos to the data providers, who will be responsible for storing and giving access to data and to keep up to date the link to reach it.

Information about entanglement has been included as optional fields because it is not the main scope of EMODnet Chemistry infrastructure. Nevertheless if available it could be managed.

A comparison with Dali (<http://doc.e-is.pro/dali/>) strategy for seafloor images data management has been suggested. Unfortunately, the information is still under development and will not be available before the first months of 2021.

If the relevant groups of interest (TWG,...) accept this proposal, EMODnet Chemistry will further develop the plan with a detailed description of the data management through a centralized database (like for beach and seafloor litter).

This choice of centralized data management, compared to the distributed solution of usual SDN/EMODnet infrastructure, shows pros and cons.

The workload (especially in the starting phase when format, database, validation tools and guidelines need to be set up) will be high and concentrated in a single NODC (OGS), thus requiring a team of skilled/experienced people to deal with it. Nevertheless, the centralized approach provides a quick flexibility which is very relevant in the starting phase. Additionally, the central database provides the chance to adapt the outputs to the needs of specific stakeholders (JRC example for beach litter baselines). Having the images and video stored at the data centers keeps the distributed approach for the “data” and overcomes possible policy issues,

Litter items, which protocol/list/codes?		(...seems that TGML list is used...)
Number of items		classes of numerosity like ramoge example?
Entanglements/interactions?	yes/no	(Jamstec seems doesn't manages it)...TGML type of entanglements/injuries!?
Entanglements/interactions?	type	(Jamstec seems doesn't manages it)...TGML type of entanglements/injuries!?

Entanglements/interactions?	nb of species	
Entanglements/interactions?	species	vocab? S25 biological entities? <a href="http://seadatanet.maris2.nl/v_bodc_vocab_v2/browse.asp?order=conceptid&amp;formname=search&amp;screen=0&amp;lib=s25&amp;v0_0=&amp;v1_0=conceptid%2Cprelabel%2Caltlabel%2Cdefinition%2Cmodified&amp;v2_0=0&amp;v0_4=&amp;v1_4=modified&amp;v2_4=9&amp;v0_5=&amp;v1_5=modified&amp;v2_5=10&amp;x=39&amp;y=23&amp;v1_6=&amp;v2_6=&amp;v1_7=&amp;v2_7=">http://seadatanet.maris2.nl/v_bodc_vocab_v2/browse.asp?order=conceptid&amp;formname=search&amp;screen=0&amp;lib=s25&amp;v0_0=&amp;v1_0=conceptid%2Cprelabel%2Caltlabel%2Cdefinition%2Cmodified&amp;v2_0=0&amp;v0_4=&amp;v1_4=modified&amp;v2_4=9&amp;v0_5=&amp;v1_5=modified&amp;v2_5=10&amp;x=39&amp;y=23&amp;v1_6=&amp;v2_6=&amp;v1_7=&amp;v2_7=</a>
Link to pictures		(Jamstec manages it)
Link to movies?		(Jamstec manages it) how to handle videos?
Link to map?		(Jamstec manages it)
